Resilience In MS: Enhancing Coping Mechanisms through Nursing Practice

Jennifer Smrtka MSN, ANP-BC, MSCN

Psychological Stressors of MS

- Neurologic conditions associated are well documented (physiologic and physical symptoms)
- Additional burdens arise from neuropsychiatric complications which are in part directly related to inflammation and demyelination
- Indirectly related to psychological effect of having to adapt to unpredictable disease course¹

Psychological Stressors of MS

As a neuropsychiatric disease affecting young people, MS threatens personal autonomy, independence, dignity, and future plans¹

Neuropsychiatric Features

Most Common¹

- Anxiety
- Depression
- Cognitive impairment
- Irritability
- Anger

- Less Common²
 - Disinhibition
 - Delirium
 - Psychosis
 - Dementia
 - Apathy
 - Behavioral disturbances

- 2. Feinstein A, Feinstein K. Depression associated with multiple sclerosis: looking beyond diagnosis to symptom expression. JAffectDisord2001; 66: 193–98.

Neurobiology Effects of Stress

- Sympathetic nervous system (SNS) responds to stress by ↑ heart rate, constricting blood vessels, ↑ blood pressure, and ↓ digestion.
- In response to acute and chronic stress, the hypothalamus secretes corticotropin-releasing factor (CRF), which in turn induces the release of adrenocorticotropin hormone (ACTH)
- ACTH stimulates the synthesis and release of cortisol and dehydroepiandrosterone (DHEA) from the adrenal gland¹

^{1.} Charney DS. Psychobiological mechanism of resilience and vulnerability: Implications for successful adaptation to extreme stress. Am J Psychiatry 2004;161:195–216.

Neurobiology Effects of Stress

- If stress remains chronic, prolonged elevations of glucococorticoids may cause serious adverse effects, such as immunosuppression, hypertension, dyslipidemia, and osteoporesis
- In contrast to cortisol, DHEA exerts antiglucocorticoid and antiglutamatergic activity in the brain and may confer neuroprotection¹

1 Karlamangla AS, Singer BH, McEwen BS, et al. Allostatic load as apredictor of functional decline. MacArthur studies of successful aging. JClin Epidemiol 2002;55:696–710.

Resilience

The capability of a strained body to recover its size and shape after deformation caused by compressive stress.
 An ability to recover from or adjust easily to misfortune or change.¹

1. Merrium-Webster Dictionary. Accessed: www.merriam-webster.com/dictionary/resilience

Neurobiology of Resilience

Resilience seems to be associated with an ability to keep the HPA-axis and noradrenergic activity within an optimal range during stress exposure and terminate the stress response once the stressor is no longer present¹

Chronicity Effects in MS

Fatigue over time

- Feeling defeated
- Feeling overwhelmed
- Feeling alone
- Loss of control
- Unpredictability of MS can lead to anxiety and despair

The Power of Hope

- A person's perception of their future, whether accurate or inaccurate, has a substantial influence on their quality of life.
- Patients who expect or hope for a favorable future rate higher than pessimistic patients on HRQoL measures, regardless of what doctors think might be more realistic appraisals.¹

Strategies to Enhance Coping

 Self-efficacy strongly predicts psychological adjustment to MS and is interlinked with self esteem, depression, and self-worth^{1,2}

Efforts should be made to involve patients in collaborative treatment³

Therapeutic Partnership Nurse and Patient/Family

- An intellectual and emotional bond that is focused on the patient/family and based on mutual trust, respect, and acceptance
 - Respects the patient/family as individual
 - Respects and accepts patient's right to chose
 - Considers ethnic and cultural aspects
 - Considers health beliefs and values
- Respects confidentiality
- Focuses on well-being
- Promotes acceptance, empowerment, well-being

Assess Patients' Character Strengths

Abundance Awareness Awe Acceptance Accountability Appreciation Aspiration Beauty Beingness Community Clarity Choice Grace

Compassion Confidence Courage Depth Discipline Dignity Forgiveness Fearlessness Flexibility Generosity Growth

Loyalty Intuition Leadership Kinship Openness Peace Power Presence Perseverance Hope Positivity Responsibility

Restraint Serenity Strength Stability **Transformation** Truth Vulnerability Vitality Integrity Love of Learning Zest

Gratitude Curiosity Worthiness Willingness Faith Tolerance

Strive for Excellence

"Signature Strengths, Self – Rating Scale" (Adapted by Jonathan Haidt, from M.E.P. Seligman, 2002: Authentic Happiness). Accessed from www.viastrenghts.org 3/10/11.

Foster Resilience to Enhance Coping Skills....

- Adaptable
- See the humor in situations
- Know where to turn for help and who
- Can handle uncertainty and is not derailed by it

Resilience.....

Optimistic, persevering
Feel strong as a person
Can handle uncomfortable feelings
Can think clearly and logically under pressure

Resilience.....

Generally feel in control of one's life

- Tendency to bounce back after hardship or illness
- Close, dependable relationships
- Over time like challenges because aware of capability to handle such situations

Resilience.....

Have sense that things happen for a reason or that later on will be able to make sense of situation to move in positive direction

Empowerment by MS Nurses

- Facilitate goal setting
- Provide experiences with peers
- Provide affirmation
- Maximize wellness
- Encourage motivation and persistence
- Affirmation of personal value and strength

Promote Health & Wellness

Because a patient has a chronic illness does not destined them to be chronically ill

 Wellness is a positive striving unique to the individual in which a person can be ill and still have wellness with a deep appreciation for the joy of living and with a life purpose¹

Empowering through the Wellness Model

| Traditional Nursing | Wellness Nursing |
|------------------------|--|
| Process | Process |
| Assessment | Implements whole person wellness; patient performs self-assessment |
| Diagnosis | Unique learning needs based on patient belief systems; patient determines needs |
| Outcome Identification | Patient determines wellness goals |
| Planning | Patient takes responsibility and develops plan for self-care |
| Implementation | Patient implements self-care and self- healing measures consistent with beliefs |
| Evaluation | Patient learns to self-evaluates results |

J. Halper (April 2005). The Advanced Practice Nurse: Role in MS Management. CNS News, p.3.

Assess your patients' coping skills...

- Nursing Diagnosis: Ineffective Coping Skills....
- "Why Me?"
- "It's not fair"....
- "Can't"
- "Unable"

Focus on patients' capabilities "What *Can* You Do"

- Changing semantics.."to myself" vs. "for myself" when it comes to medications
 MS...Crisis or Opportunity (It's the context)
- Identifying factors that are NOT unpredictable...
- Diet
- Exercise
- Sleep
- Hydrate
- Support
- Attitude

Who Am I in the face of this?

"everything can be taken from a man but one thing: the last of the human freedoms—to choose one's attitude in any given set of circumstances, to choose one's own way."

 Viktor Frankel M.D., PhD., Man's Search for Meaning, 1956 (Neurologist, Psychiatrist & Holocaust survivor)
